1. Introduction

The Milan.com prototype was designed to create an easy to use and simple matrimonial site. The aim was to overcome any usability issues found when looking at sites such as Shaadi.com. The design was improved with simple navigation, well laid out profiles, simplified partner search, easy to complete registration and easy to compare membership options.

Five participants interacted with the main features of the prototype. They were asked questions to gain feedback relating to their interaction with the prototype. The qualitative observations were analysed to determine if the design changes made to Milan.com had a positive impact on the user experience.

2. Findings & Design Improvements

Homepage & Navigation: The homepage was clean and easy to use with the main call-to-action button easily seen. This was much simpler to use than Shaadi.com. The clean look means users will quickly understand what the site is for and where to start.

Profile Structure: Users liked that the profiles were well structured. The details were split into sections making it easy for users to find what they are looking for and determine if they match with the person. This solves the issue of having a lot of information to scroll through.

Search & Partner Matching: The search results were easy to use with the profile cards and easy filtering. Users liked that they could see basic details without clicking into each profile. They could also filter based on their preferences. The match percentages were helpful to understand how compatible they are. This should make finding partners more streamlined, efficient and focused.

Registration: Users found the registration process much easier to follow due to the simple steps. This means users aren't overwhelmed with the amount of information. It provides a more guided process.

Membership Options: The membership options were easy to compare. They were clearly laid out meaning users could understand what options are available. This solves the issue of having to find the right membership option.

3. Quantitative Overview

Overview of positive feedback from the 5 interview summaries:

Feature Being Measured

Positive Feedback

Homepage & Navigation

5/5 (100%)

Profile Details

5/5 (100%)

Search & Profiles

5/5 (100%)

Registration Process

5/5 (100%)

Membership Options

5/5 (100%)

All 5 interview summaries included positive feedback. The percentage shows how many of the interviews included positive feedback. The qualitative data backs this up with users often commenting that Milan.com was simple, well structured, easy to understand and less overwhelming than Shaadi.com.

4. Conclusion

From the qualitative and descriptive quantitative data we can conclude that Milan.com shows a positive improvement to the perceived user experience. All 5 participants gave positive feedback for the main features. The homepage, profile structure, filtering, registration and membership options were all well received.

Overall users found Milan.com to be easier to use and cleaner than Shaadi.com. The prototype solves the common usability issues by keeping the design simple, providing easy access to key profile details, simplifying the search process and guiding users through important decisions.

Overall the key strength of Milan.com seems to be that it is simple and easy to use. It doesn't overwhelm users with too much information and instead provides users with key features in a structured way to help them progress from searching profiles to understanding membership options.

Final Verdict: Overall Milan.com has met its main UI/UX goal showing that it can provide a simple, clear and easy to use matrimonial site. The positive feedback from all 5 participants shows that the design improvements have been well received. The prototype shows that with some thoughtful design it is possible to create a convenient, easy to use and comfortable matchmaking site.
