ASSIGNMENT 01

Aim :-

To critically analyse existing Indian matrimonial application interfaces and identify opportunities to improve their learnability, usability, consistency, navigation, visual hierarchy and overall user experience.

Problem Statement :-

The objective is to analyse the user interface of an existing matrimonial app and identify areas of improvement. The selected domain is Indian Matrimonial Apps, with Shaadi.com as primary apps.

Theory :-

UI concerns the visual and interactive elements of an app.
UX focuses on the overall experience of a user interacting with the application.

- Learnability : interface should be easy for new users to understand.
- Usability : users should be able to search for profiles, apply filters (age, religion, community, location) and express interest efficiently.
- Consistency : colours, fonts, icons etc. should remain consistant across screens.
- Use of Metaphors : Familiar symbols such as a heart icon for interest, shortlist / bookmark icon, chat bubble for messages, etc.
- Visual Hierarchy : Important info such as profile image, age, profession, location, photo privacy status etc.

GOPI
Page No.:
Date: / /

→ Critical Analysis :-

Metric	Shaadi.com	BharatMatrimony
Learnability	8.5 /10	8.8/10
Usability	8.8/10	8.2/10
Consistency	9.0/10	8.5/10

→ Conclusion :-

The analysis helped identify areas where existing Indian matrimonial applications could be improved to deliver a smoother, more trustworthy and user-centric matchmaking experience.

ASSIGNMENT 02

Aim :-

To study user requirements and match-seeking behaviour, analyse existing matrimonial interfaces and develop user personas.

Problem Statement :-

Matrimonial apps serve users with different goals and expectations. Some users prioritize high-trust profiles and verified credentials, while others focus on family preferences, location, compatibility and privacy control.

Theory :-

User Research is an important part of the UX design process because it helps designers understand people who will use an app.

Research and Planning :-

1. Study of existing apps :
   - Shaadi.com was noted for its extensive filters, chat features and profile recommendations, but promotional upgrades and ads can make its home feed feel crowded.
   - BharatMatrimony was noted for clean community-based segmentation and structured profile layouts.
2. Identification of user needs :
   - Relevant match profiles without excess scrolling.
   - Granular filter options (caste / community / occupation / education)
   - Profile authenticity
   - Clear photo privacy settings

GOPI
Page No.:
Date : / /

3. Persona :-

- Analysis indicates that the app should support several connected activities ; browsing profiles, refined search and applying filters. The design should also help users maintain control over their partner preference & communication decisions.

→ Conclusion :-

The research and planning stage established a user-centered foundation for the matrimonial application design.

ASSIGNMENT 03

Aim :-

To design low-fidelity wireframes for Shaadi.com by arranging major interface elements.

Problem Statement :-

After analysing matrimonial applications and identifying user requirements, represent them through wireframes. A wireframe provides a simplified view of an interface and helps designers plan the placement of content.

Create a low-fi wireframe that addrss identified problems.

Theory :-

- Lofi wireframes for Shaadi.com were prepared as hand-drawn screen layouts for principal screens to establish the main flow.
- The wireframes helped establish content heirarchy, screen structure & relationships btw main matchmaking tasks.
- By seperating structure from visual details, focus remained on layout clarity, search usability & intiuive navigation.
- Also provides a refernce for the subsequent hi-fi design stage.

Conclusion :-

The Lo-fi wireframe translates the findings from problem analysis and user research into a structured, intuitive interface.

ASSIGNMENT 04

Aim :-

To transform Lo-fi wireframes of Shaadi.com into a Hi-Fi interface using Figma, apply a consistent visual design system and present the features in a polished layout.

Problem Statement :-

Lo-fi wireframes establish the basic structure of an app, but do not fully communicate the final appearance of the app.

Theory :-

Hi-Fi UI design represents an interface in greater visual detail than a lo-fi wireframe. It includes intended visual style, detailed components, typography, spacing, colours, icons and imagery.

A successful Hi-Fi design should not focus only on appearance. It should also preserve usability, make actions easy to identify, provide clear feedback and smooth transitions.

1. Translate wireframes into detailed screens.
2. Establish the visual identity.
3. Designing match discovery.
4. Designing profile info and preference comparison.
5. Designing connection request and contact access.

Conclusion :-

High-Fidelity design is the stage in which planned interface becomes a detailed visual representation.

ASSIGNMENT 05

Aim :-

To evaluate the Shaadi.com app prototype using heuristic evaluation principles, identify issues and suggest improvements.

Problem Statement :-

The Shaadi.com app may present usability challenges related to match discovery, filter application, contact requests, navigation, and profile privacy information.

Theory :-

Heuristic evaluation is a usability inspection method used to identify interface problems using established usability principles. Evaluation examines user control, simplicity, consistency, predictability and other factors affecting the user experience.

Key Findings :-

- User Control
- Simplicity
- Consistency
- Profile Info
- Connection & Communication

Additional Observations :-

Evaluation also recommended authentic user verification badges & cross-platform desktop along mobile experience synchronization.

Conclusion :-

Total Score : 51 / 75

The heuristic evaluation identified opportunities to improve Shaadi.com prototype usability, consistency, match discovery and user feedback.

ASSIGNMENT 06

AIM: To study usability testing of a Figma prototype using Maze.

THEORY:

Maze is a remote usability testing tool used to test interactive website prototypes created in Figma. It allows users to test a design independently without a moderator. The Figma prototype is imported into Maze using a shareable link, and participants complete assigned task through a testing link.

Procedure:

Create a clickable prototype in Figma and enable link sharing.
Create an account on Maze and start a new test.
Import the Figma prototype using its share link
Add tasks and follow up questions
Share the test link with participants
Analyse results, generate a report.

Features and Applications of Maze:

- Heatmaps to visualise user clicks
- Success rate, misclick rate and task completion time
- A/B testing to compare different designs
- Automatic reports to improve user experience

CONCLUSION:

Maze helps designers evaluate the usability of Figma prototypes remotely. It identifies usability problems through user interactions and feedbacks, enabling designers to improve website design before development.

* FAQs

Q.1 Define the objective of user testing.

A. The objective of user testing is to identify usability and evaluate how users can navigate and complete tasks.

Q.2 Discuss different method of user testing.

A. Moderated testing, unmoderated testing, remote testing, in-person and A/B testing

Q.3 Explain the features and benefits of Maze.

A. Maze provides prototype testing, heatmaps, task success rate, misclick analysis and automatic reports. It saves time, reduces testing costs and helps improve user experience.

Assignment - 07

AIM : To redesign the project interface for users with special needs and create an accessible, inclusive prototype.

THEORY : Accessible design ensures that people with different abilities can use an interface effectively. It considers users with visual, hearing, motor, cognitive or age related difficulties.

Design Guidelines :

Use high colour contrast (min. 4.5 : 1 for normal text)
Use readable text
Provide large buttons & touch targets.
Add labels & alternative texts.
Use simple language, consistent layouts & clear error messages.

Procedure :

Open the previous project in Figma
Select a target user group & identify their needs.
Duplicate the file and redesign 3-4 screens.
Link the screens to create an interactive prototype

GOPI
Page No.:
Date : / /

5. Test with at least two users and improve the design.
6. Check accessibility using a checklist & conti

* Conclusion :

The interface was redesigned to improve accessibility & usability for users with special needs.
